Aluminum Coated Silicon Wafers

Aluminum is one of the most widely used metals. Aluminum is light weight, a good conductor of heat and electricity, and has high reflectivity. Aluminum is often used for reflective optical components in telescopes, headlamps and LEDs. A thin surface layer of oxide forms at the air interface of the aluminum film, which protects the metal against corrosion.

4"-diameter 525-um thick silicon wafer coated with 100-nm of Aluminum (99.999% purity),
1 count
